

I imagine my object (a water bottle) to replace a tank behind truck tanks like the one shown above. It would be placed horizontally portraying a fallen truck in the middle of a highway.

The purpose of my object in its normal space is to hold liquid for easy transport. Similar to tanks found in gas/liquid carrying tank trucks. It alters the viewpoint in a way that the water bottle will be largely scaled. In its ordinary space the object's size is compared to that of a key. In this other reality, the object is scaled bigger than a person/as large as a truck.
